# Basic Programming Fundamentals

Variables

Data Types

Operators

**Numerical :**  
int, float, long,  
complex

**String**

**Boolean**

**Custom** and Built in  
Data Types and Data  
Structures

**Arithmetic**  
+, -, \*, /, //, %, \*\*,

**Assignment:**  
=

**Comparison:**  
==, !=, >, <, >=, <=

**Logical**  
and, or, not

**Bitwise**  
&, |, ^, ~, <<, >>

**Identity**  
is, is not

**Membership**  
in, not in

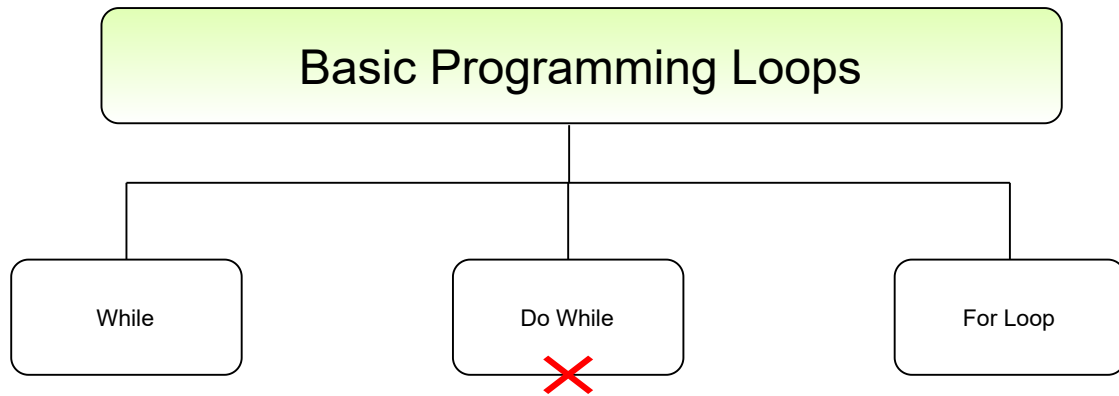

**Calculate**

Area  
Perimeter  
 $D$   
 $d$

## Control Flow

## Uses :

- Do while is not available in Python but can be implemented using a simple trick
- Use while loop when you dont know the excat number of iterations to do
- Use for loop when you know the exact number of iterations to do

# Control Statement

```
graph TD; A[Control Statement] --> B[break]; A --> C[continue]; A --> D[pass];
```

break

continue

pass

# DataStructures in Python

Inbuilt Data  
Structures

Custom  
Data Structures

Advanced  
Containers

Sequence

Non Sequence

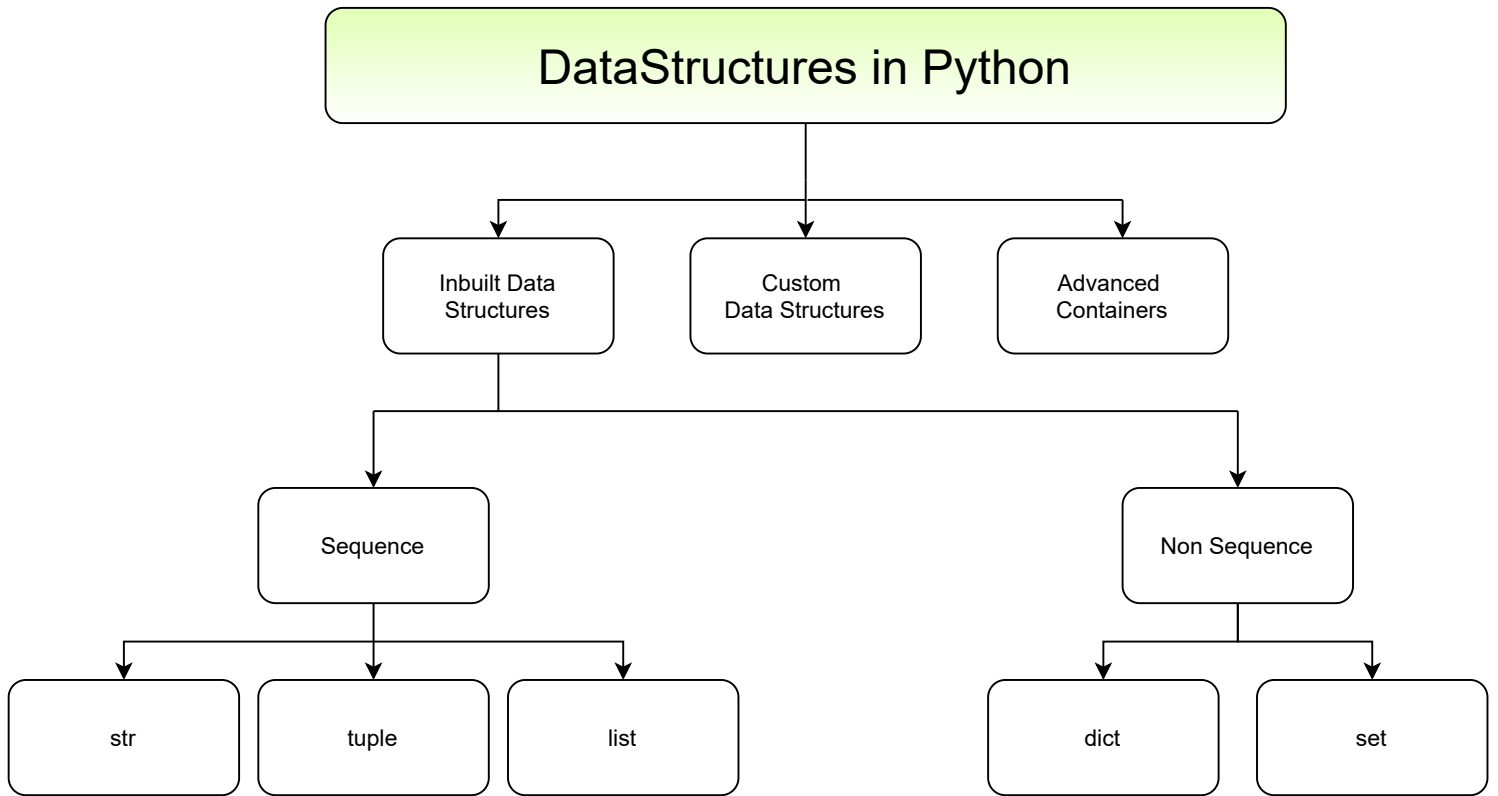

str

tuple

list

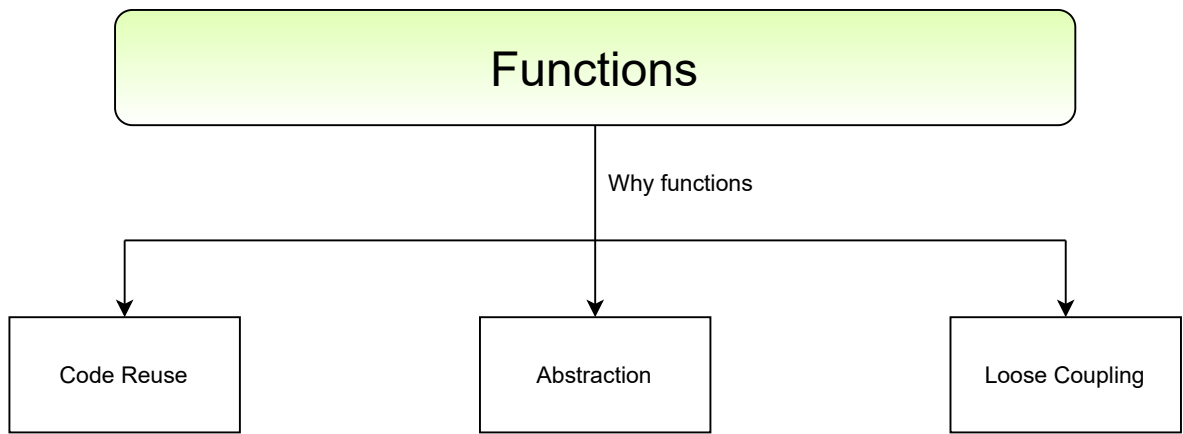

dict

set

## Importance of Data Structures

## Comprehension

# Function Structure

Name

0 or More Parameters  
Variable Parameters - \*args / \*\*args

Optional Docstring

Body / executable code

1 return

## Notes

Functions are not run in the program until they are called or invoked

Formal vs Actual parameter

Print vs Return

Global Scope vs Function Scope

None is returned if there are no return in function

Parameter for a function can be another function

## Importance of dict & set for search
